Personnel

The research at Colgate University will be performed by co-PI Moore.

Deliverables

The deliverables from Colgate University include algorithms, computational tools, peer-reviewed publications, presentations at conferences, and outreach. The deliverables will be centered around the following tasks taken directly from the Project Description.

1: Characterizing permeability, anisotropy, and pore size dynamics to inform Darcy-based homogenized models. The high-fidelity numerical simulations permit precise measurements of coarse-grained quantities such as permeability and anisotropy, as they depend on medium features such as porosity and microstructure geometry. Statistical measurements of these properties taken from large batches of the numerical simulations will inform reduced models based on Darcy's law with variable permeability to represent unresolved pore-structure that varies dynamically in time due to erosion.

2: Developing and validating new parameterizations using machine learning techniques and numerical simulations. The batches of high-fidelity simulations will be used to train machine learning and deep-neural networks. These new models will parameterize the effects of erosion on the evolution of macroscopic properties. Once trained, the networks will enable predictions of how medium properties respond dynamically to changes in environmental conditions without reliance on the (more expensive) direct physical simulations.

Timeline

Deliverable 1 has been completed and a manuscript is currently under review at Physica D. Year 3 will focus on deliverable 2.

Coordination with PI Quaife

Throughout the project, co-PI Moore will work closely with both PI Quaife and the funded Ph.D. student at FSU, Jake Cherry. This will include frequent emails and phone conversations, 1–2 Zoom and/or Google Meet meetings per month. The code and papers will be maintained on GitHub.
